

Open your eyes to better AMD management.

About NOTAL VISION™

Notal Vision™ was founded in 2000 by medical professionals from internationally renowned hospitals. The goal - to introduce a new standard in AMD detection and treatment, educate the public and eliminate the threat of the disease over the next decade.

Foresee PHP™ is the first comprehensive solution for detecting and monitoring the progress of AMD including the dangerous wet stage that generally does not exhibit symptoms at its early phase.

Ask your doctor about the Foresee PHP™, a new early detection and monitoring system that can help save your vision!

- Non-invasive eye exams
- Easy to perform
- Test results within minutes
- FDA cleared

|| The PHP is worth every second spent if it is going to detect any progression of my AMD and help me save my sight so I can continue to drive, read and see my family. I recommend this test to anyone and feel fortunate to be blessed with the care of Dr. Miller and his devotion to managing my disease with the most innovative technology. ||

Age-related Macular Degeneration (AMD)

One of every five people over age 65 in the U.S. has AMD, which is the leading cause of blindness in people over 50. It may cause blindness in about 20% of affected people if not managed correctly.

AMD is a treatable disease. **Early and frequent monitoring of patients with AMD can detect the disease even before symptoms appear**, allowing for early treatment that will save vision.

How AMD destroys your sight?

The eye has a highly sensitive tissue in the macula region - an area in the back of the eye where light is focused and nerve signals transfer images to the brain. This allows for central vision - sharp focus in the center of your visual range. AMD progressively destroys the macula slowly damaging your central vision.

The two types of AMD

- Dry AMD

AMD begins in its dry form, from which most people with AMD suffer. Dry AMD progresses slowly and does not generally result in severe loss of vision. Many patients notice nothing and will just add more light for reading. Dry AMD usually starts in one eye, and occurs later in the second eye.

Because progression is painless and gradual, many people consider the slight damage of central vision to be a normal part of aging. **But there is nothing normal about dry AMD** - particularly if it progresses to the more severe wet AMD.

- Wet AMD

15 to 20 percent of people with intermediate-stage dry AMD progress to the wet form of the disease. At this stage, tiny blood vessels beneath the retina grow out of control, which can cause blood and fluid to leak under the retina. The resulting damage can be devastating, leading to rapid, severe and permanent central vision loss - that is, unless it is detected early and treated immediately.

A simple test can help save your sight — Foresee PHP™

Your doctor now offers AMD testing with Foresee PHP™: a simple, quick, FDA cleared, clinically-proven and non-invasive way to detect changes in the central area of your vision.

Foresee PHP™ is designed to reveal wet AMD at its onset and early stages, before the damage causes permanent vision loss.

What to expect in the Foresee PHP™ test

A number of linear dot patterns are displayed on a touch-sensitive screen. You will be asked to use a plastic pointer to touch the screen where you see distortions (bumps in the line). **That's it.**

Using a customized Foresee PHP™ database and detailed printouts from your exam, your doctor can detect the signs of wet AMD within about 15 minutes.

There are a number of safe, proven therapies for AMD, including medications and laser surgery. If you require therapy, your doctor will discuss the options most suitable to your needs.

With AMD, there is no time to lose

Don't wait! What may seem like normal age-related vision loss could be something much more devastating.

Ask your doctor about AMD monitoring with Foresee PHP™ today.

Regular testing with Foresee PHP™, after initial detection, can let you and your doctor know if your AMD is progressing to the severe, wet form of the disease before you experience the first visual symptoms - and this can help save your vision.
